

## Ch-12 Basics of Geometry

### Introduction to Geometry

- 1) The word geometry is derived from the Greek word 'geo' means Earth and 'metron' means measurement. Hence, Geometry means **measurement of Earth**.
- 2) Geometry is used to measure different shapes and sizes such as circles, squares, cubes, triangles etc.
- 3) So any object which is present on Earth has a shape which is defined by geometry.
- 4) **Euclid**, a Greek mathematician has invented geometry. He is also known as the "**Father of Geometry**".

### Basic Geometrical Terms

- 1) **Point** → (a) A point is an exact location in plane or space.

**. P**

- (b) It is represented by a dot (.) and denoted with a capital letter like point P
- (c) It has no length, no width and no height.
- (d) Example:- Location on a map, Centre of the dashboard

- 2) **Line** → (a) A line is a straight path of points that extends on and on in both the directions without ever ending.

- (b) It is represented as PQ (line PQ) or QP (line QP).
- (c) The length of line cannot be measured.
- (d) There are generally 3 types of lines;

#### **Horizontal lines**

goes straight.

#### **Vertical lines**

goes straight up and down.

#### **Curved Lines** are of

curve shape.

3) **Line Segment** → (a) A part of a line is called a line segment. It has a fixed length.

(b) The points at which the line segment begins and ends are called endpoints.

(c) Every line segment has 2 endpoints.

(d) It is represented as  $\overline{CD}$  or  $\overline{DC}$  (line segment CD or DC)

4) **Ray** → (a) It is a straight path that has one endpoint and goes on and on in one direction.

(b) It is denoted by  $\overrightarrow{PQ}$  (ray PQ) .

(c) Examples:- Rays from the sun , Rays of light from a torch.

(5) **Plane** → (a) A plane is a flat surface that extends infinitely in all directions.

(b) It has no thickness.

(c) Examples:- Surface of a paper , a table and a slanted rooftop.
