

Define Filter Keys

Filter Keys is a Microsoft Windows accessibility feature that allows the computer to ignore brief and repeated keystrokes that may be caused by slow or inaccurate finger movements. It's a way where software features can help people with physical issues. **Filter Keys** is one such feature which tells the keyboard to ignore repeated keystrokes. People with hand tremors might hit the same key again, and again, this is where Filter Keys help.

Turn on or off Filter Keys in Windows 10

Method 1 –

You can enable Filter Keys using the **right SHIFT key**. When you keep it pressed for **8 seconds**, it will activate the Filter Keys.

Method 2 -

1. Type *Control Panel* on the search box, and click to open it.
2. Then open Ease of Access > Change how your keyboard works > Filter Keys and click on it to open "Setup Filter keys."
3. Check the box "Turn on Filter keys."

To turn off Filter Keys, you have to uncheck the box.

Method 3 –

Open **Settings** > Ease of Access> Keyboard.
